

Texas Civil Commitment Office

Supervision Progress Report

- **Penile Plethysmograph (PPG):** Mr. Baiza submitted for a PPG on 10/14/22. The results displayed response to 6 of the 21 segments in the basic adult series and 6 of the 11 segments from the rape series of the Monarch 21 PPG.
- **Biennial:** Mr. Baiza's biennial was e-filed on 05/22/23; his next biennial is due May 2025.
- **Annual review:** Mr. Baiza's annual review is due April 2024.
- **Mental Health- Medication:** Mr. Baiza is not on the mental health caseload for medication.
- **Medical Information:** Mr. Baiza is having an issue with his right shoulder and bicep ; he is working with medical to address the issue.
- **Cost recovery:** Mr. Baiza is compliant with cost recovery at this time.
- **Parole/Probation:** Mr. Baiza is not on dual supervision.
- **Interaction with others:** Mr. Baiza participates, asks questions, is polite, helps others; no issues with the client on behalf of clinical therapist.
- **Employment Information:** Mr. Baiza is not employed; he is on the volunteer list.
- **Collaterals:** There are no pending collaterals at this time, however, he is having trouble contacting a few collaterals whom are already approved. .
- **Case Manager (CM):** CM had no supervision issue with the client during the review period.
- **GPS Charge History:** Mr. Baiza is no longer on GPS monitoring.
- **Education:** Mr. Baiza does have a GED.
- **Cell Phone:** Mr. Baiza is not eligible for a cell phone at this time.

RADIOLOGY REPORT

=====

MRI SHOULDER RT W/O DYE 73221

CLINICAL HISTORY: Right shoulder pain. Status of tendons and biceps quality.

COMPARISON: None

TECHNIQUE: Multisequential and multiplanar images of the right shoulder were submitted for review without contrast.

FINDINGS:

TENDONS AND MUSCLES:

Mild supraspinatus and infraspinatus insertional tendinosis without surface fraying or focal tear. No supraspinatus or infraspinatus muscle edema or atrophy. The rotator cuff interval is within normal limits.

Mild superior subscapularis tendinosis without surface fraying or focal tear. No subscapularis muscle edema or atrophy.

Significantly attenuated biceps tendon in the bicipital groove with no healthy remnant in the intra-articular segment.

The teres minor muscle demonstrates no edema or atrophy.

The deltoid muscle is within normal limits in signal without edema or atrophy.

LABRUM:

The anterior superior labrum is attenuated likely Buford complex. Rest of the labrum is grossly intact.

OSSEOUS STRUCTURES:

The acromioclavicular joint is well approximated and demonstrates mild

Nov. 16. 2023 11:31AM

No. 5443 P. 5

osteoarthrosis with lateral clavicular subchondral edema.

Bone marrow signal is otherwise within normal limits without bone contusion, fracture or AVN.

SOFT TISSUES:

There is no glenohumeral joint effusion.

There is no periarticular bursitis.

There are no intraarticular osteochondral bodies.

There are no soft tissue masses. Normal subcutaneous adipose space.

IMPRESSION:

1. Mild supraspinatus, infraspinatus and subscapularis tendinosis without discrete tear.
2. No any intra-articular biceps tendon remnant.

RADIOLOGY REPORT

=====

MRI UPPER EXT NON JOINT RT W/O 73218

CLINICAL HISTORY: Elbow pain

COMPARISON: None

TECHNIQUE: Multi-sequential and multiplanar images of the elbow were submitted for review without contrast.

FINDINGS:

The common flexor tendons are intact without tendinosis or peritendinitis. Normal ulnar collateral ligamentous complex. The common extensor tendons are intact without tendinosis or peritendinitis. Intact radial collateral ligament and lateral ulnar collateral ligament.? Intact annular ligament. Intact biceps tendon with a normal attachment on the radial bicipital tuberosity, without tendinosis.? There are no peritendinous fluid collections or inflammation.? Intact brachialis tendon without tendinosis. The triceps tendon is unremarkable.? Bone marrow signal is within normal limits without bone contusion, fracture or AVN. Well-preserved articular cartilage without focal defect or osteochondral lesion. The cubital tunnel is within normal limits, without evidence of ulnar nerve entrapment or compressive neuropathy.? Normal epicondylo-olecranon ligament (Osborne's ligament). There is no anconeus epitrochlearis. The radial and median nerves are within normal limits without entrapment or compressive neuropathy.? The antebrachial fascia and muscles of the elbow are normal without mass, strain or hematoma.

IMPRESSION:

1. No obvious or significant abnormality detected in the present study.

PATIENT NAME TIMOTHY BAIZA	DATE OF BIRTH 12/19/1979	SEX Male	X-RAY NUMBER 30047567
REFERRING PHYSICIAN BROSELOW ROBERT J MD			DATE OF SERVICE

MRI of the right proximal arm was provided for previous trauma and pain.

Impression:

Long head of the biceps tendon is appropriately positioned within intertubercular groove, with some suspected thinning and possibly partial tear.

Edema-like changes at the acromioclavicular joint, with mild to moderate arthritic changes. Suspected tendinopathy within supraspinatus tendon. No definite rotator cuff tear. Overall, shoulder is limited in evaluation due to large field-of-view. Consider dedicated shoulder MRI if there is related clinical concern.

Provider Progress/Narrative Note**Type of Note:**☒ NarrativeNarrative**Narrative Note:**

f/up post visit with ortho for right shoulder pain/right arm deformity.

Pt injured his shoulder more than 8 months ago; He slipped and fell (supported his weight with his right hand). He heard a "pop" sound when he fell.

Right shoulder pain is tolerable. Mobic helping with pain.

MRI right shoulder showed No rotator cuff tear, and tendonitis.

MRI right arm showed bicep tendon partial tear.

Per Dr. Joshi, surgery is not indicated (cosmetic deformity).
